Special remote elements depending on the activated plugins

Basically a remote element is a layout and / or command element that can be placed anywhere on the page.

Additionally to the general remote elements, which are standard features of NEO, there some special remote elements (eg tado °) which depend on the plugins you have activated.

Such special elements are groups of general elements that can be assigned automatically in one step to a plugin-device. For this purpose the plugin gateway / device must be applied in the device manager first. Once integrated the special plug-in element can be placed on the remote page. Now a dialog box aks you to assign the gateway / device.
