

Color chooser element

With this remote element you can define the color of RGB-LEDs. To add the element click on the color chooser icon. A round color chooser will appear on the remote page. You can adjust the size of the element via corner controls or by filling in the values in the properties menu. The size is limited to a minimum of 100 pixels.

The color chooser element is designed as a selector for all compatible RGB controllers and RGB lamps regardless of the number of displayable colors. For this purpose the system will automatically select the color which is closest to the current selection point. You can assign a RGB-LED device in the properties menu.
