Integrate QIVICON homebase as Gateway

If you are using the AIO CREATOR NEO with a QIVICON plug-in, you can integrate the QIVICON homebase as a gateway in the device manager. For this purpose you can use the "search gateway" button, to import the configuration of your QIVICON homebase automatically. Alternatively you can configure your QIVICON homebase manually by clicking the "new gateway" button.

If you use the "search gateway" function, please select "QIVICON" in the first step.

Important note:
The QIVICON homebase can only be found and imported automatically, if it is in the same subnet as the computer, on which the AIO CREATOR NEO software is used.

If your hombase has been found, it can be imported by clicking the "import" button. If necessary you additionally have to enter User and Password of your QIVICON homebase.

If your QIVICON homebase has not been found automatically, you can configure it manually. In this case please click the "new gateway" button. Now enter a name, select the type (QIVICON) and enter IP-address, Port-Number, User and Password of your QIVICON homebase.
